Measures to Reduce Greenhouse Gas Emissions

Our hotel has implemented and planned the following measures to reduce greenhouse gas emissions:

Energy Efficiency

Approximately 90% of the air-conditioning units in our hotel rooms are energy-efficient models. The invoice for the newly purchased air-conditioning units is attached. All lighting throughout our hotel uses LED technology. Through these measures, we aim to achieve energy savings of approximately 5–6%.

Reducing Meat Consumption

We have removed two meat dishes from our menu and replaced them with locally sourced vegetable dishes. With this initiative, we aim to reduce meat consumption by approximately 2–3%.

Water Conservation

To reduce water consumption, a report will be submitted to the employer regarding the cost of implementing a drip irrigation system for garden watering.

In addition, for the upcoming season, we plan to replace the washbasin and bathroom faucets in our guest rooms and inspect the general water supply systems. Through these measures, we aim to achieve water savings of approximately 5–8%.
